Final Report

Analyze and predict digital currency

Name: Meshal Fahad Almubarak

The dataset contains 4,857,377 row with 7 features for each. A few feature highlights include range of open price, close, low, and High. Nearly a third of the individual features could be grouped into more general categories, and an analysis of 4 of them was undertaken to inform baseline models and feature engineering.

Feature Engineering
-Combining particular Feature and ranges of numeric features to highlight strong signals and illogical values status identified during EDA
-The entire training dataset of 4,857,377 records was split into 0.1 train vs. holdout. Predictions on the 10% holdout were limited to the very end, so this split was only used and scores seen just once.

Final result: 50 layers on deep learning (`LSTM`)
